

Networked CCTV System

Networked CCTV System

A reliable networked CCTV system protects assets and keeps people safe.

The PCCW Solutions' approach is compatible with a wide range of equipment and facilitates real-time monitoring of multiple premises such as offices, shops, malls, educational institutions and many others.

Technical support is provided to minimize cost of initial installation and system setup. This could include converting existing analogue video to digital, for example, or deploying analogue camera.

Fast response 7x24 maintenance service is available so as to save maintenance team setup cost.

One option is for us to host your video management system in our highly-secure cloud platform for customers to access via web and mobile client interfaces. It saves space in your premises and no IT operation and maintenance cost are required.

A quality networked surveillance system keeps watch over people and property from anywhere at any time via a laptop, workstation or mobile device. Video recordings are always available for review and can be transferred to a local drive.

A networked CCTV system from PCCW Solutions represents one of the shortest routes to genuine peace of mind.

The fast setup and dismantling characteristics are especially suitable for event organizers.

Features

- Central management user interface controls all connected cameras, devices, storage and user access.
- Alarm Manager consolidates all alarms for easy monitoring and management.
- A camera navigator helps track moving objects via use of different cameras.
- Bookmarks allow users to mark video sections and add descriptive notes to extract video evidence swiftly for analysis or sharing.
- The network can be managed or monitored anytime, from anywhere.
- 7x24 fast response maintenance service.
- Fast cameras and system setup and dismantling with our Cloud platform service.
- Integration with other system alarms (e.g. door temper/ access control).
- High quality video recording and transferring to local drive.
- Complies with government and industry regulations.

Benefits

- Video database encryption protects stored video from illegal viewing, modification or tampering.
- Edge Storage is a redundancy option to ensure continuous audio and video recording. In the event of interruption, recording is stored internally, then uploads automatically to the cloud platform once normal network service resumes.
- Supports unlimited number of cameras, users and sites.
- Cloud-based platform option cuts cost of IT infrastructure investment.
- Cloud-based network infrastructure configuration option offers scalability and facilitates flexible expansion of office, shop or institute.
